

CURVED COMPONENTS FOR CONVEYORS & SORTERS

Conveyor systems play an integral role in various industries, from efficiently managing baggage in airports to streamlining the movement of parcels in delivery facilities, or in the food processing industry. In today's dynamic landscape, these systems are not merely mechanisms for transportation; they are the backbone of seamless operations, expected to meet the most rigorous demands. At Sjolund, we recognize the paramount importance of ensuring that our components align with these exacting standards.

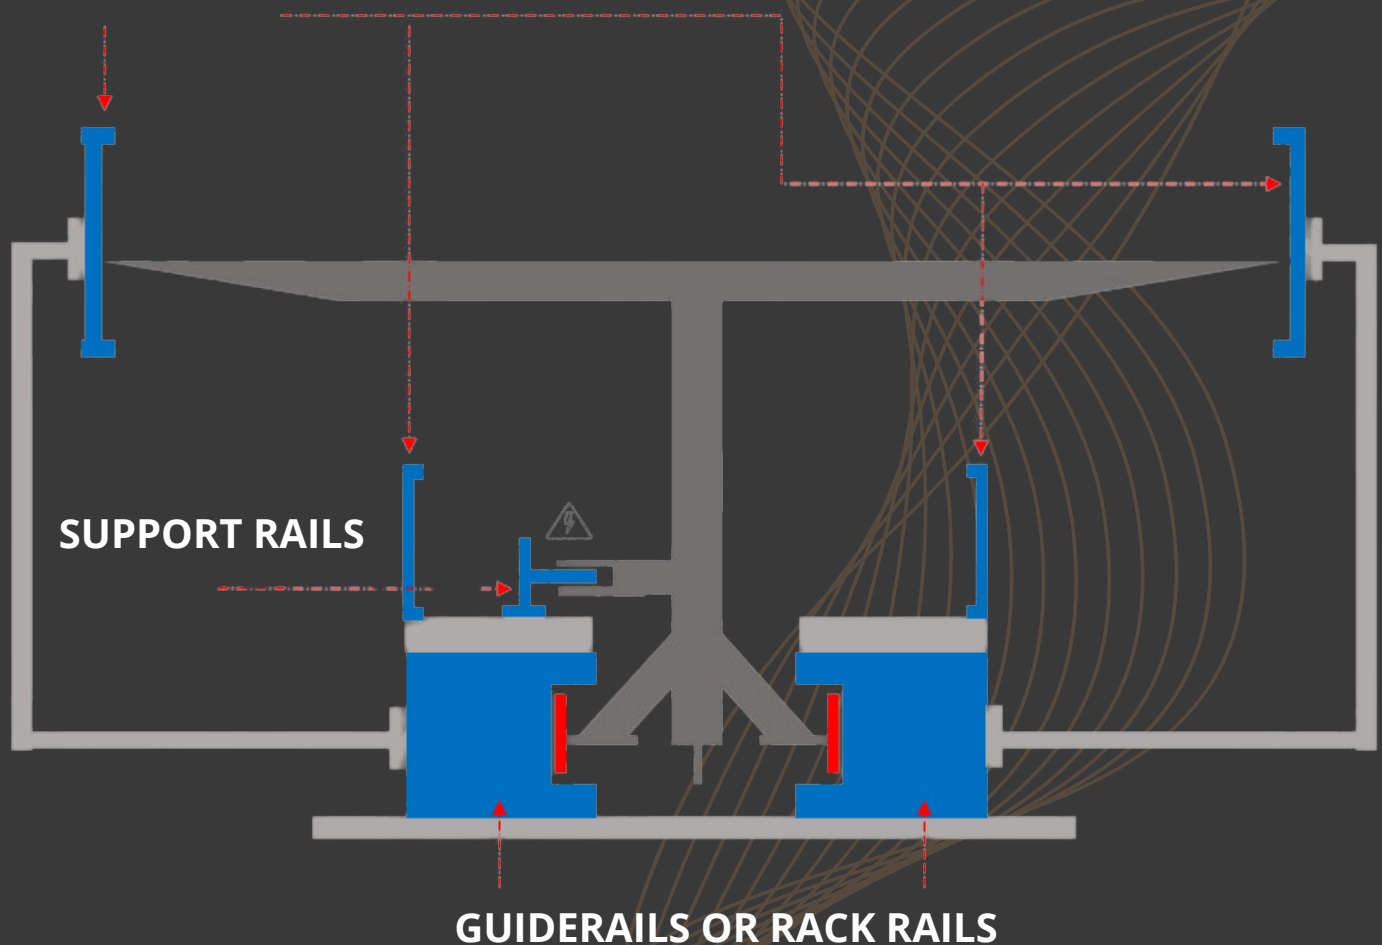

Conveyor systems, that you find in baggage handling systems or in parcel industries today must withstand the highest requirements - just like our components will! At Sjølund we are happy to support you with any kind of horizontal, vertical or helical curved components made from aluminum, steel or stainless steel.

Within conveyors you will find plenty of components that are bent and curved such as sideguards, support rails, guide rails and rack components.

In our technical scheme of a tilt tray sorter below you will find many different examples of curved components that Sjolund can support you with.

SIDEGUARDS

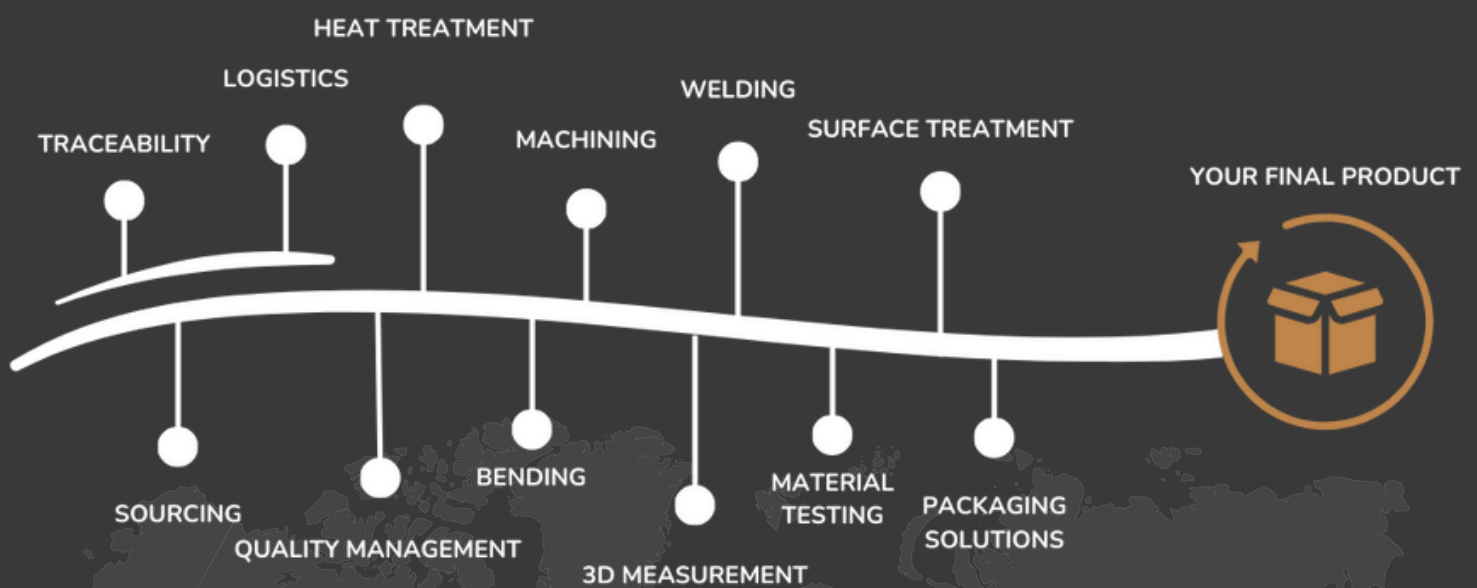

Blue = curved profiles made from aluminium or steel

Grey = Remaining structure of the sorter

We will provide you with excellent performance on the work steps that we will add to your component, such as bending, heat treatment, surface treatment, machining, documentation, packaging etc.

But furthermore, we will be focused on all the aspects that are important to fit to your workflow and to establish a B2B partnership that you are looking for today.

If you seek a steady supplier committed to delivering components as promised and on time, Sjølund welcomes your inquiry. Let's collaborate to build a future of precision and partnership together!
